

Neutropenic Fever Protocol

This fictional protocol exists only to test document import. It is not clinical guidance.

1. Recognition

Suspect neutropenic fever when a patient receiving chemotherapy has a temperature of 38.0 degrees or higher and a neutrophil count below 0.5 in this example.

2. First Hour Actions

Take blood cultures before the first dose of antibiotics. Give the first dose of Zorbaxil 2 g intravenously within 60 minutes of arrival.

3. Review

Review the patient at 48 hours. Step down to oral therapy only after a senior review.
